

Option with dust-protection

Dust protection is available as a standard option for all sizes of grippers of the PGN-plus and PZN-plus series. This option increases the degree of protection against penetrating materials. A mounting set makes it possible to retrofit existing modules of these series with this option.

Application:

- In contaminated and dusty environments

Additional benefits	Additional expense
- Improved resistance of the gripper in contaminated environments - Longer life	- Components for mounting set must be manufactured separately and mounted

Note:

- The dust-proof version guarantees no protection against humidity
- It is generally recommended to operate the gripper with sealed air (max. pressure 1 bar)
- Available as a modification for other gripper series
