

ROTA NCF *plus* 2

**Power lathe chuck with
centrifugal force com-
pensation and large
through-hole**

Weight-optimized power lathe chuck with integrated centrifugal force compensation for reducing the loss of clamping force under speed of rotation

High speeds mean high centrifugal forces of the jaws and thus high clamping force losses in turning applications. The ROTA NCF plus 2 with integrated centrifugal force compensation effectively counteracts this loss of clamping force. As a result, significantly higher speeds can be run than with conventional lathe chucks. The modular sealed center sleeve system also increases flexibility.

Function of ROTA NCF plus 2

The axially movable piston transfers the force to the base jaw and generates a radial jaw movement synchronized with the rotational axis. The jaws are coupled to a compensating weight via a lever, which leads to a constant clamping force when the lathe chuck rotates.

Integrated centrifugal force compensation

Compared to conventional lathe chucks, the loss of clamping force is compensated by the integrated centrifugal force compensation. Due to the speed, the centrifugal force balancing weight is pressed to the outside. The lever directly transmits the force onto the base jaw.

- ❶ Centrifugal force via compensation weight
- ❷ Clamping force support for O.D. clamping

Changing the center sleeve

The modular center sleeves can be changed quickly and easily while the chuck remains mounted. When the three screws are undone, all the protection sleeves can be pulled off from the front and replaced.

Optimized wedge hook and precision jaw guidance

For longer life time and high repeat accuracy, fine serration 1/16" x 90° or 1.5 mm x 60°.

- ❶ Trapezoidal angle
Between the base jaw and piston
- ❷ Precision flat guidance

Additional sealing inside of the center sleeve and optimized greasing system

Therefore the maintenance intervals are longer and permanent supply to all function and friction surfaces is ensured.

- ❶ Modular center sleeve
Also exchangeable in built-in condition from the front chuck face
- ❷ Long piston guidance
For more accuracy

Integrated, patented grease-pump system in the centrifugal force compensation

For permanent grease circulation during every clamping stroke. Extended maintenance intervals can be realized as a result

Very rigid and hardened chuck body

With direct short taper mounting without intermediate flange.

- ① Chuck body
- ② Piston

Modular center sleeve system

The modular center sleeve system increases flexibility for the most various applications in everyday life.

1 Adjustable stop in the center sleeve

The adjustable stop ensures that all workpieces are stopped with high repeat accuracy in the same selectable position. This makes handling quick and easy.

2 Part ejector in the center sleeve

An optimum addition for automatic loading. The part ejector disposes of a gas spring, which will eject your workpiece safely out of the chuck.

3 Coolant nozzles in the center sleeve

Ideal as an additional component if your machine is equipped with a central coolant supply. For I.D. machining, coolant will be fed directly to the tool.

4 Closed center sleeve

The closed center sleeve prevents penetration of chips and coolant into the through-hole.

① Modular center sleeve system up to size 315 possible.

Subject to technical changes.

① Distance to center of first tooth

② Piston stroke direction

Direct adapter plates

Direct adapter plates are used if the spindle mounting bolt circle has the same size as the lathe chuck mounting bolt circle. The adapter plate has to be mounted on to the spindle together with the lathe chuck. The adapter plate is preassembled on the lathe chuck.

Reduction adapter plates FF-T2

Reduction adapter plates are used if the mounting bolt circle of the spindle is smaller than the one of the lathe chuck mounting bolt circle. The adapter plate is first mounted on the spindle and then the lathe chuck is mounted on the adapter plate.

Expansion adapter plates FF-T3

Expansion adapter plates are used if the mounting bolt circle of the spindle is larger than the one of the lathe chuck mounting bolt circle. The adapter plate is first mounted on the spindle and then the lathe chuck is mounted on the adapter plate.
